SOFTWARE CHECKLIST

Upgrade your software V1 (from SE1) to a V2.0 (Showcase-Ready) (to SE2)

A transition from "it works" to "it is reliable and professional."

Here is a checklist of enhancements to ensure your software stands out at the fest:

Kindly check whether your software already meets the criteria.

1. Robustness & Reliability (The "No-Crash" Rule)

In V1, users often forgive bugs; in V2.0, stability is expected.

[✔] **Input Validation:** Ensure every text field, dropdown, and upload button has constraints (e.g., no empty submissions, character limits, file type checks).

[✔] **Graceful Error Handling:** Replace console errors with user-friendly "Toast" notifications or modals that explain what went wrong and how to fix it.

[✔] **Edge Case Testing:** Test your app with "empty states" (e.g., what does the dashboard look like if there is zero data?).

[✔] **Loading Indicators:** Add spinners or progress bars to any action that takes longer than 300ms.

REMARKS:

- Input validation remains to be polished, as text field input fo all roles are to be reviewed and still under development for checking if there's constraints
- Enforce strong password policies (min length, special characters)
- Modals feature or notification that explain the action if there's something wrong is not even yet implemented to the system
- For the deletion indicators this is implemented now to the system.
- Fix: Pharmacist for Reject Prescription Not Working.
- Admin System Activity fixes logs based on real time periods.
- Adding algorithm fixes in revenue on order summary report do not include the pending, processing and cancelled status.
- Loading Indicators: Add user indicators especially Note indicators when users are doing action specifically when deleting (for Now this is applied on the Deleting part).

2. User Experience (UX) & Polish

This is where you make the software feel "expensive" and intuitive.

[✔] **Navigation Refinement:** Ensure the user never feels "stuck." There should always be a clear way to go back or return to the home screen.

[✔] **UI Consistency:** Standardize your margins, font sizes, and button styles. Use a consistent color palette (3–4 primary colors max).

[✔] **Empty State Designs:** Instead of a blank white screen when no data exists, add an illustration and a "Get Started" button.

[✔] **Responsive Design:** If it's a web app, ensure it doesn't break when viewed on a laptop vs. a large monitor or tablet.

REMARKS:

Has been Implemented

- Admin: In generating report for the stats of certain role it now fix and does not generate a blank state.
- A return, go to, go back and refresh in each dashboard of the user.
- For large lists (medicines, transactions), implement pagination (show limited items per page on that view screen

To be Fix and Added.

- Fix: When there is blank data or empty data the header subtly goes below.
- In landing page instead of simultaneously more tabs for logging in it will be on three tabs with a button of patient, admin and staff member and on the staff member there's the position for another landing page for the staff position to choose what their role is: Pharmacist, Inventory Manager, Billing Clerk, and Staff Member this feature is not yet implemented
- Fix: UI/UX adjustments, header placement, text placement
- Placement of tabs in dashboard

3. Feature Depth (The "V2.0" Additions)

Add one or two "Power Features" that show technical growth.

[✔] **Search & Filter:** If you have a list or gallery, add a real-time search bar and at least two filtering options (e.g., by date, category, or status).

[✔] **Data Persistence:** Ensure user data is saved properly to a database (Firebase, Supabase, MongoDB, etc.) so it doesn't disappear on refresh.

[✔] **User Feedback:** Implement a "Success" state (e.g., a green checkmark or "Saved!" message) whenever a user completes an action.

[✔] **Authentication:** If V1 was open, add a "Sign in with Google" or "GitHub" option to show you can handle secure sessions.

REMARKS:

- An authentication using Google will be implemented at login/signup for every roles
- Audit Trail that log critical actions (who deleted what, when inventory was updated)
- Sensitive data (passwords, personal info) should be hashed/encrypted
- To add a mini- see tab to know what is components is find there before opening or going to another dashboard a mini tab on what is on that dashboard so it can become efficient when finding something.

Has Been Implemented

- In Patient (Upload Prescription): In the submit prescription it should detect the Doctor's Name that is currently log in the Dashboard and also Medicine that is available.
- In Patient: Notification of number of orders and notification red badger in adding in cart
- Add a notification text on my orders on how many orders the patient has.
- The report generation date applies in real time (This one relies on a database on what date it was generated.
- Position of stats card and the stats card size (The generated report for all dashboard).

4. Developer Quality & Documentation

Judges often look at what's "under the hood" during a software fest.

[✔] **Code Cleanup:** Remove all console.log statements, comment out "dead" code, and unused variables.

[X] **README Overhaul:** Your GitHub/Documentation should include:

- A clear **high-resolution screenshot** or GIF of the app.
- **Setup instructions** (How to run it locally).
- A **"What's New in V2.0"** section.

[X] **Deployment:** Ensure the app is hosted on a live URL (Vercel, Netlify, Heroku) so judges can access it on their own devices.

REMARKS:

- Every code needs to be rechecked for unused variables and comments.
- README will be updated when the 2.0 version of the app is finalized.
- The v1.0 application did not used any hosting for deployment yet.
- To Add Profile Setting UI for Pharmacist, Billing Clerk, Staff, and Inventory Manager (For now Patient only have it).

Priority Matrix (What to do first?)

Priority	Task	Why?
High	Bug Fixes & Validation	A broken feature is worse than a missing feature.
Medium	UI/UX Polish	First impressions are visual; "ugly" software is hard to sell.
Low	New "Extra" Features	Only add these once the core V1 features are 100% stable.

Note: List below all the Criteria or your Add-Ons on your software v1 that fall under High, Medium, and Low Priority.

Priority	Task	Why?
High	Bug Fixes & Validation	~~● Broken feature for generating reports, especially stats reports.~~ ~~● Validation indicators when the user successfully filters an option.~~ ~~● Fix: Pharmacist: Reject Prescription Not Working.~~ ~~● Admin System Activity fixes logs based on real-time periods. The current time period seems broken.~~ ~~● Fixes of Statistics Overview in Admin (some appear to be grey when generated).~~ ~~● Adding algorithm fixes in revenue on the order summary report does not include the pending, processing, and cancelled statuses.~~ ~~● Loading Indicators: Add user indicators, especially note indicators when users are doing an action, specifically when deleting (for now, this is applied to the deleting part).~~ ~~● Also, add a limitation where the Completion of the order by the staff will be set to complete once the pharmacist approves the prescription, and the bill of that patient is set to Paid once the billing clerk reads, creates the invoice, and sets it to paid. It will then appear to the patient order view and prescription view that their input is set~~

		~~to complete and has received their prescribed order (medicine).~~ ~~● The report generation date applies in real time~~ ~~● Admin System Activity fixes logs based on real-time periods. The current time period seems broken.~~ ~~● Order numbers are not in ascending order in the Patient Orders and Invoice Receipts, Invoice Create Bills~~
Medium	UI/UX Polish	~~● Resolution or window size affects the application elements, like text fields and buttons.~~ ~~● Spacing of columns and tables needs to be adjusted.~~ ● Some Dashboard headers need to be adjusted. ~~● A return, go to, go back, and refresh in each dashboard of the user.~~ ~~● Clean Interface: In the landing page, instead of simultaneously having more tabs for logging in, it will be an authorization login with Google sign-in, then after that, the staff member can choose what their role is: Pharmacist, Inventory Manager, Billing Clerk, or Staff Member.~~ ~~● Empty State of Background: Add a design in the background so it will not appear empty, especially when logging in, on the dashboard, etc.~~ ● Placement of tabs in the dashboard ● UI/UX adjustments ○ Header Placement ☑ ~~Patient main dashboard~~ ☑ ~~Admin main dashboard~~ ☑ ~~Pharm main dashboard~~

		☑ ~~Inventory Manager main dashboard~~ ☑ ~~Billing Clerk main dashboard~~ ☑ ~~Staff Member's main dashboard~~
Low	New "Extra" Features	• Extra Features to be added include: ○ ~~Broken/bug stat report.~~ ○ ~~Refresh button for each dashboard and table.~~ ○ ~~In Patient (Upload Prescription): In the submitted prescription, it should detect the doctor's name that is currently logged in the Dashboard, and also the available medicine.~~ ○ ~~In Patient: Notification of the number of orders and notification of red badger when adding to the cart.~~ ○ ~~Add a notification text on my orders on how many orders the patient has.~~ ○ ~~The report generation date applies in real time (This one relies on a database on what date it was generated.~~ ○ ~~Position of the stats card and the stats card size.~~ ○ ~~For User Profiles, it is optional to plan to add settings for them to add Basic Authentication (Basic Profile adding Address, Number, and Email)~~. ○ To add a mini see tab to know what the components are, find them there before opening or going to another dashboard, a mini tab on what is on that dashboard, so it can become efficient when finding something.

		~~○ Add Profile Setting UI for Pharmacist, Billing Clerk, Staff, and Inventory Manager.~~ ~~○ Users and Staff cannot have the same username, full name, or email~~ ~~○ Add in inventory management, a tracking new dashboard for the inventory manager can make real-time changes to track orders.~~

MAJOR FEATURES TO BE ADDED (Affected All Dashboard):

- [x] ~~Loading Indicators: Add user indicators, especially note indicators when users are doing an action, specifically when deleting (for now, this is applied to the deleting part).~~
- [x] ~~Clean Interface: In the landing page, instead of simultaneously more tabs for logging in, it will be on three tabs with a button for patient, admin, and staff member and on the staff member, there's a position for another landing page for the staff position to choose what their role is: Pharmacist, Inventory Manager, Billing Clerk, and Staff Member.~~
- [x] ~~Empty State of Background: Add a design in the background so it will not appear empty, especially when logging in, dashboard, etc.~~
- [x] ~~A return, go to, go back, and refresh in each dashboard of the user.~~

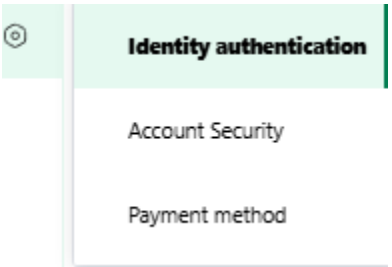
FEATURES and FIXES TO BE ADDED:

- [x] ~~A LOGO has not yet been implemented that will appear on the left header side of every dashboard.~~
- [ ] Placement of tabs in the dashboard
- [ ] UI adjustments in some pages
- [x] ~~Header Placement~~

  With header placement being fixed now, it needs to expand all content of the stats card so that there is no blank in the footer on the main dashboard.
- [x] ~~Patient main dashboard (checked)~~

- [x] ~~Admin main dashboard (checked)~~
- [x] ~~Pharm main dashboard (Checked)~~
- [x] ~~Inventory Manager inventory manager dashboard (to fix the table to expand it to the right)~~
- [x] ~~Billing Clerk main dashboard~~
- [x] ~~Staff Member's main dashboard~~
- [x] ~~Fixes of Statistics Overview in Admin (some appear to be grey when generated)~~
- [x] ~~For User Profile, it is optional to plan to add settings for them to add Basic Authentication (Basic Profile adding Address, Number, and Email)~~
- [ ] To add a mini- see tab to know what the components are, find them there before opening or going to another dashboard, a mini tab on what is on that dashboard, so it can become efficient when finding something.

Ex:



- [x] ~~In Patient (Upload Prescription): In the submitted prescription, it should detect the doctor's name who is currently logged in the Dashboard, and also the available medicine.~~
- [x] ~~In Patient: Notification of the number of orders and notification of red badger when adding to the cart~~
- [x] ~~In Admin Dashboard:~~
- [x] ~~Adding algorithm fixes in revenue on the order summary report does not include the pending, processing, and cancelled statuses.~~
- [x] ~~Position of the stats card and the stats card size.~~
- [x] ~~Add a notification text on my orders on how many orders the patient has.~~
- [x] ~~The report generation date applies in real time (This one relies on a database on what date it was generated.~~

- [x] ~~Admin System Activity fixes logs based on real-time periods. The current time period seems broken.~~
- [x] ~~Add Profile Setting UI for Pharmacist, Billing Clerk, Staff, and Inventory Manager.~~
- [x] ~~Fix: Pharmacist: Reject Prescription Not Working.~~
- [x] ~~Add a warning (red border) when the user doesn't input anything in the text field~~
- [x] ~~Order numbers are not in ascending order in the Patient Orders and Invoice Receipts, Invoice Create Bills~~

To be added and fixed:

- [x] ~~Toast notification color in one view~~
- [x] ~~The spacing of the toast notification~~
- [x] ~~The arrangement of the orders should be ascending~~
- [x] ~~Users and Staff cannot have the same username, full name, or email~~
- [x] ~~Add role selection in sign up~~
- [x] ~~Add in inventory management, a tracking new dashboard for the inventory manager can make real-time changes to track orders.~~
- [x] ~~Also, add a limitation where the Completion of the order by the staff will be set to complete once the pharmacist approves the prescription, and the bill of that patient is set to Paid once the billing clerk reads, creates the invoice, and sets it to paid. It will then appear to the patient order view and prescription view that their input is set to complete and has received their prescribed order (medicine).~~
